

Sample Id : 2510004189
 Patient Name : Mr. Ganesh Rajput
 Age/Gender : 26 Year/Male
 Ref. By : Dr. M.JUNAID
 Collected at : MAIN
 Center : Bio Care Diagnostic Center

Patient ID : 129
 Collection Date : 13/10/2025
 Receiving Date : 13/10/2025
 Reporting Date : 13/10/2025
 Printing Date : 13/10/2025

HAEMATOLOGY

COMPLETE BLOOD COUNT (CBC)

HAEMOGLOBIN	12.8	Normal	gm/dl	12.0-18.0
TOTAL LEUCOCYTE COUNT	5200	Normal	/cumm	4000-11000
DIFFERENTIAL LEUCOCYTE COUNT				
Neutrophils	73	Normal	%.	40-75
Lymphocytes	20	Normal	%.	20-45
Eosinophils	01	Normal	%.	00-06
Monocytes	06	Normal	%.	00-08
Basophils	00	Normal	%.	00-01
TOTAL R.B.C. COUNT	4.41	Normal	million/cumm	3.5-6.5
P.C.V./ Haematocrit value	38.10	Normal	%	35-54
M C V	86.39	Normal	fL	76- 96
M C H	29.02	Normal	pg	27.00-32.00
M C H C	33.60	Normal	g/dl	30.50-34.50
PLATELET COUNT	1.02	Low	lacs/mm3	1.50 - 4.50
E.S.R. (Westergren Method)	19	Normal	mm/1st hr.	0 - 20
MALARIAL PARASITE	NOT SEEN			

NOTE --

Malaria is a serious,sometimes fatal,parasitic diseases characterized by fever,chills,and anaemia and is caused by a parasite that is transmitted from one human to another by the bite of infected anopheles mosquitoes. There are four kinds of malaria that can infect humans : P.F.,P.V.,P.Ovale,and p.malariae.In humans,the parasite migrate to the liver where they mature and release another form,the merozoites.

SEROLOGY

WIDAL TEST

		1/20,	1/40,	1/80,	1/120,	1/160,	1/240,	1/320
Salmonella Typhi `O`	:	+	+	+	+	+	—	—
Salmonella Typhi `H`	:	+	+	+	—	—	—	—
Salmonella Paratyphi `AH`	:	+	+	—	—	—	—	—
Salmonella Paratyphi `BH`	:	+	+	—	—	—	—	—

RESULT: WIDAL TEST IS POSITIVE

Widal Agglutination test is carried out to confirm the diagnosis of Enteric fever. Causative organisms in these cases principally are Salmonella typhi, Salmonella paratyphi A & Salmonella paratyphi B in India. These organisms have 'H' (Flagellar) & 'O' (somatic) antigens. Sera from normal population & patients with Enteric fever agglutinating antibodies in variable concentration. Test is performed with serially increasing dilutions. Agglutination in dilution up to <1:60 is seen in normal individuals. Agglutination in dilution 1:160 is suggestive of Salmonella infection. Agglutination in dilution of & more than 1:320 is confirmatory of Enteric Fever. Causative organism is determined by species specific 'H' antigen showing significant titre. Individual who had suffered Salmonella infection in the past may show mild to moderate increase in titre while suffering from unrelated illness. Similarly, those vaccinated against Enteric Fever, show non-specific rise in titre against more than one 'H' antigen. Widal test carried out on paired sample during acute phase & during convalescent phase (10-14) days after first sample shows four fold rise in titre is considered diagnostic of Enteric fever.
